

Homework #5

Ismail SEZEN

Due date Dec 1, 2023 00:00 EET

Objective: Gain hands-on experience with the apply family of functions (`apply`, `lapply`, `sapply`, `vapply`, `tapply`, `mapply`) in R. Understand their use in different data manipulation and analysis scenarios.

Data: Use any publicly available dataset(s) relevant to environmental science, meteorology, or a field of your choice. The dataset should have a mix of numeric and categorical variables and be suitable for applying various statistical functions.

Tasks:

1- Data Exploration with `apply`: (20pts)

- Explain the dataset you have chosen and the variables it contains.
- Load your chosen dataset into R.
- Use the `apply` function to calculate the mean and standard deviation for each numeric variable in the dataset. (**Bonus:** Normalize these numeric variables using `apply` +10pts)

2- List Processing with `lapply` and `sapply`: (20pts)

- Create a list of several vectors, each representing different daily measurements of a particular pollutant.
- Use `lapply` to calculate the median of each vector.
- Then, use `sapply` to find the variance of each vector.

3- Factor Analysis with `tapply`: (20pts)

- Group your data based on a categorical variable (e.g., city or date).
- Use `tapply` to calculate the sum of a particular numeric variable within each group.

4- Safe Apply with `vapply`: (20pts)

- Create a function that returns a numeric vector of fixed length.
- Use `vapply` to apply this function to a list or vector, ensuring that the output has the correct length and type.

5- Parallel Processing with `mapply`: (20pts)

- Create two or more vectors of equal length, each representing different environmental measurements.
- Use `mapply` to calculate a combined metric (of your choice) for each set of corresponding elements from the vectors.

Bonus Challenge with `rapply`: (+20pts)

- Create a nested list structure representing measurements from different locations and days.
- Use `rapply` to apply a function at a specific level of the list (e.g., calculate a summary statistic for each day).

Assessment Criteria:

- Correctness and efficiency of the R code.
- Understanding of the apply functions and their appropriate usage.
- Clarity and thoroughness of the report.

Notes:

- Please, email your answers privately to `sezenismail` at `gmail` `com`.
- Answers/codes should be in a text file named `name_surname.r`.
- Please, include your dataset in the same folder with your R script file or provide a link to the dataset.
- Do not use `for-loop` statements.
- Write the methodology and rationale for using each *apply function* as *R comments* in the text file.
